

What is claimed is:

1. A zoom lens system comprising a positive first lens group, a negative second lens group, a positive third lens group, and a negative fourth lens group, in this order from an object,

wherein zooming is performed by moving each of said positive first through said negative fourth lens groups along the optical axis;

wherein said zoom lens system satisfies the following conditions:

$$0.5 < (D_{12T} - D_{12W})/f_w < 1.0$$

$$1.0 < \Delta X_{1G}/\Delta X_{4G} < 1.5$$

wherein

$D_{12T}$  designates the axial distance between said positive first lens group and said negative second lens group at the long focal length extremity;

$D_{12W}$  designates the axial distance between said positive first lens group and said negative second lens group at the short focal length extremity;

$f_w$  designates the focal length of the entire the zoom lens system at the short focal length extremity;

$\Delta X_{1G}$  designates the traveling distance of said positive first lens group from the short focal length extremity to the long focal length extremity; and

$\Delta X_{4G}$  designates the traveling distance of said

negative fourth lens group from the short focal length extremity to the long focal length extremity

2. The zoom lens system according to claim 1, satisfying the following condition:

5            $0.1 < f_w/f_{1G} < 0.3$

wherein

$f_{1G}$  designates the focal length of said positive first lens group.

3. The zoom lens system according to claim 1, 10 satisfying the following condition:

$0.05 < (D_{23W} - D_{23T})/f_w < 0.15$

wherein

$D_{23W}$  designates the axial distance between said negative second lens group and said positive third lens 15 group at the short focal length extremity; and

$D_{23T}$  designates the axial distance between said negative second and said positive third lens group at the long focal length extremity.

4. The zoom lens system according to claim 1, 20 satisfying the following condition:

$0.1 < (f_{23T}/f_{23W})/(f_T/f_w) < 0.4$

wherein

$f_{23T}$  designates the combined focal length of said negative second lens group and said positive third lens 25 group at the long focal length extremity;

$f_{23w}$  designates the combined focal length of said negative second lens group and said positive third lens group at the short focal length extremity; and

$f_t$  designates the focal length of the entire the zoom 5 lens system at the long focal length extremity.

5. The zoom lens system according to claim 1, satisfying the following condition:

$$1.15 < h_{3g} / h_1 < 1.30$$

wherein

10  $h_1$  designates the height of paraxial light ray, from the optical axis, being incident on the most object-side surface of said positive first lens group at the short focal length extremity; and

15  $h_{3g}$  designates the height of the paraxial light ray, from the optical axis, being incident on the most image-side surface of said positive third lens group at the short focal length extremity, when the paraxial light ray has been incident at the height of  $h_1$  on the most object-side surface of said positive first lens 20 group.

6. The zoom lens system according to claim 1, wherein said positive third lens group comprises at least one aspherical surface that satisfies the following condition:

$$25 -30 < \Delta I_{asp} < -10$$

wherein

$\Delta I_{ASP}$  designates the amount of change of the spherical aberration coefficient due to the aspherical surface in said positive third lens group under the condition that the 5 focal length at the short focal length extremity is converted to 1.0.

7. The zoom lens system according to claim 1, wherein said negative fourth lens group comprises at least one aspherical surface that satisfies the following 10 condition:

$$0 < \Delta V_{ASP} < 3$$

wherein

$\Delta V_{ASP}$  designates the amount of change of the distortion coefficient due to the aspherical surface in 15 said negative fourth lens group under the condition that the focal length at the short focal length extremity is converted to 1.0.
